AN OBSERVATION OF Aedes Aegypti (Yellow  
Fever Mosquito) IN OKLAHOMA

Roy W. Jones and Wallace Coyner, Edmond

Yellow fever mosquitoes, *Aedes Aegypti*, were observed in all stages in several different places in Edmond, Oklahoma, during September and October, 1933.

Specimens were collected by the authors and final identification made by Dr. Robert Matheson of Cornell University. From observations the authors would judge these mosquitoes to be more or less common in this locality. No extended observations or collections have been made, however.
