

A SPECIES OF NEOTOMA NEW FOR OKLAHOMA

H. D. CHASE and B. D. BARCLAY, Tulsa

While we were making an excursion through the Mesa country in western Oklahoma during the summer of 1938, three specimens of *Neotoma mexicana fallax* were found. The specimens were taken in live traps among the mesas in the Tesequite Canyon on July 13 and 15. It was suspected that this species had not been recorded for the state, and upon investigation this was found to be the case.

The specimens were checked by Dr. Frank Blair, of the University of Michigan, and skins of the species are in the collection at the University of Tulsa.
